(1) If exceptionally speed measurement and traffic measurement have been processed separately, then enter 2 separate runs, each with its own date and hours: first a speed-only run (w/o NetC); then a traffic-only pseudo-run (w/o the 3 Ls).

Please note that: (a) NetC to enter for the traffic-only run is the sum of the obtained counts at both fixed places for the same duration NetT, equal to NetT as obtained for the speed-only run; (b) thus the NetTs to enter for both runs are equal. See SOURCE Handbook, Chap.2, parag.6.3 and 7.2.

(2) If there are several measuring runs on a given section, please enter each run in a different column. You'll decide afterwards whether to process or to ignore each of them.

Runs marked as "To be ignored" are not considered for calculation. Hence weights figuring herebelow will be automatically shared between all the non-ignored runs on a given section later.

Prerequisite: Group all the packs corresponding to the measuring runs on the sections of a link. Check them thoroughly.

1. Enter a new link
2. Enter the full section series of this link
3. Enter now the data of all the runs on any section of this link
4. Then go to the following link and process the same way
5. Exceptionally, you can decide to « ignore » a previously-entered run
